

Task 3: Iris Flower Classification

Project Overview

This project predicts the species of an Iris flower using machine learning based on flower measurements.

Objective

Build a classification model that accurately identifies the Iris flower species.

Technologies Used

- Python
- NumPy
- Pandas
- Matplotlib
- Seaborn
- Scikit-learn
- Jupyter Notebook

Workflow

Import the required libraries.

Load and preprocess the data.

Visualize the data.

Split the data into training and testing sets.

Train the machine learning model.

Test the model.

Predict the flower species.

Result

The model successfully classifies Iris flower species with high accuracy.

Developed as part of a Machine Learning Internship.
